```
This invention describes novel synthetic antigenic peptides (A) based on the human chorionic gonadorropin (hofo beta subunit. These peptides have contraceptive properties and are used for the development of vaccines used to control fertility in aminals and to generate polyclonal antiesta for disaposetic use. The peptides are more specific immunogens than corresponding unmodified peptides are more specific. Itself why do not elicit antibodies that cross-react with human lutelinishing homome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chortonic gonadotropin; hCG; three-dimensional; 3D; analogue; molecular simulation; visual display; chemical structure; growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

The SEQUENCE FROK N.A.

This page 2., Valts J., Meyer H.H.D.; the beta LH determinant loop to Fischer S., Valts J., Meyer H.H.D.; the beta LH determinant loop to The Contiderated anino acid sequence of the beta LH determinant loop to the contiderate perissodactyls and the estimated impact on the biological activity.

It submitted (FEB-1999) to the EMBL/GenBank/DDBJ databases.

The present invention describes an antigen (A) comprising a carrier chemically conjugated with a polypeptide (I) capable of elicting of antibody response to human chorionic gonadotropin (GG) and not to human clustenisting homone (LH), or a polypeptide (I) capable of elicting antibody response to human GG. (A) has cycostatic, contraceptive, antibipartensive and antidodabetic activities, and can be used as part of a vaccine. (A) has cycostatic, contraception, abortion and for treating homone related diseases, for treating homone associated carcinomas and to boost an animals resistance to exogenous proteins e.g. viral proteins. (A) is also useful in animal fertility control, for treating cancer, hypertension, diabetes and related vacuular control, for treating cancer, hypertension, diabetes and related vacuular control, succeeded of influenced by unusual excesses of certain controls sucked or influenced by unusual excesses of certain controls capability and effective and safe method of terminating a perganney soon provides an effective and safe method of terminating a perganney soon after conception which does not have serious harmful side effects.

The present sequence represents the human CG beta subunit amino acid invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Numan, chorionic gonadotropin antigen; follicle stimulating hormone; contraception, abortion; hormone related disease, carcinoma; cytostatic; contraceptive; antiinfertility; antihypertensive; antidiabetic; vaccine; fertility; cancer; hypertension; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antigen for treating hormone related diseases, is conjugated with a specific polypeptide which elicits an antibody response against human chorlouic gonadcropin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human chorionic gonadotropin beta subunit amino acid sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stevens VC;
                                                                                                                                                                                                                                                                                                                        AAB20558;
                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to determining whether an analogue of human channel genedicropin (hCG) will have an altered three-dimensional (31) structure as compared to hCG. Analogues of hCG and other glycoprotein brommones are produced by inputting chemical changes to the 3D structure computer loaded with 3D molecular simulation software and care into a computer loaded with 3D molecular simulation software and care representing visually on a computer display on inputing into the data input of the computer at least one operator change in chemical structure of the hCG molecule, the molecular spinlation software produces a nodified 3D molecular tepresentation of the analogue structure. The 3D computed structure of the hCG molecular structure of the maniogues at maniogues of hCG, follice standard hormone, intennising hormone, thyroid sthaulating hormone, which may act as agonists or antagonists. The analogues and for treatment in vivo to enhance to vite and produced by this mathod the hormone, which states and maniogues of hCG fortilitation techniques and for treatment in vivo to enhance of entility. The present sequence regressents the beta subunit of hCG. Specified positions at stracture of analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

as diagnostic tools to detect the presence of antibodies with respect to assay kits for assessing the levels of these hornores in various samples as and in detecting and puritying receptors to which the native hormones bind. The single chain forms of the heterodiners or homodiners bave the following advantages over their dimeric forms: they are more stable, problems of recombinant production are reduced since only a single center is needed to transcribe, translate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the activity of the dimer. The linkage between the submults permits the protein to be engineered without disturbing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human chorionic gonadotropin beta-subunit fragment (1-145 amino acids).

The protein is an important glycoprotein hormone heterodimer, along with luteninsing hormone (LB), follicle stimulating hormone (FSH), thyroid stimulating hormone (TR), which all have identical alpha subunits but differing beta subunits. The proteins are useful for generating antibodies specifically immorpeacity with new compounds, as substitutes for the hemonestive with new sons of the hormones, in the treatment of infertility as add for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormones. The single chain proteins are further useful as reagents in a manner similar to the heterodimers,

The sequence represents the beta-subunit of human chorionic gonadotrophin detacks. For the sequence represents the beta-subunit of human chorionic polaratic have disulficide bridged analogues of amino acid residues 38-57 of beta-sico have disulficide bridged inAking the cysteline residues at positions 38 and 57 to form a loop structure. The perfectes are used in workines to raise the human pitutiary luterinising homono, to control the biological activity of endogenous RiCs. These antibodies may be used in disquosite presented to rests to determine hormone levels of mammals. The peptides can be used in pregnancy tests and in detection of reduced fertility or infartility. They may also be administered for contraception or abortion processes to human so treas in hormone-associated carcinomas.
                                                                                                                                                                                                                                                                    Peptide analogues of beta-human chorionic gonadotrophin which are able to state antibodies against human chorionic gonadotrophin are used in vaccines as contraceptives and/or abortificants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human chorlonic gonadotrophin; HCG; contraception; abortion; the more related disorder; hormone-related carcinoma; cancer; diabetes; vascular disease; Zollinger-Ellison syndrome; chronic digestive disorder; antigenic modification.

```
The present sequence is given in a specification relating to the present polypeptides originally isolated from human early pregnancy utrine, now synthetically produced, as well as functional equivalents of these polypeptides. Novel beta-human chorionic gonadotrophin (hCG) fragments, designated Maternin (RTM) and referred to as MA and pMA peptides, are disclosed. Both native and synthetic MA Inhibited growth of human tumour cells inplanted into immuno deficited more by between 60 to 100%. Telative to control studies. The therapeutic MA polypeptides are disclosed for the prevention and treatment of a range of diseases and disorders, including human immunodeficiency virus (HTV) infections, disorders, including human immunodeficiency virus (HTV) infections, disorders (especially Kaposi's sarcoma), wasting disorders, hemantopoletic disorders (and anamoles), inflammation and angiogenic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             99.14; Score 770; DB 22; Length 145;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the beta-subunit of human chorionic gonadorrophin (#GG). The #GC beta-subunit polypeptide sequence is condoctrophin (#GG). The #GC beta-subunit polypeptide sequence is considered to a carrier of the disulfide bridge infinity of the terminal cysteine amino acids of polyperides and beta set in a conjugated to a carrier. The #GC antigent considered to be used in a vaccine composition for providing an entitled response to #GG in a mammal. The novel #GC antigent considered are useful for the purpose of contraception, abortion.

Confiders interment of hormone-related disease states and to boost an animal's restance of hormone-saccited carcinomas, and to boost an Glassate integrate of disorders, treatment of hormone-saccited carcinomas, and to boost an Contraction peptides are also useful for treating accept dispetes. The world disease the disorders and contracting accepting a such as a structures of chronic dispetitive disorders. Also described are various structures of chronic dispetitive disorders. Also described are various structures contraction and public are non-antigento, non-endogenous materials in the body of the animals, with consequent reduced risk of demage to the immune system, if exposed to non-endogenous materials in the body of the animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The sequence is encoded by an analogue of hCG beta subunit cDNA contgrieve slient mutations which eliminate restriction sites, it was prepted from the plasmid pKMB hCG beta, a construct contgrieve hCG beta subunit isolated from hman plasmid pKHB of Goodman) in plasmid pKMB, a derivative of pUCIB designed for facilitate cloung of glycoprotein hormones. The sequence as used as the starting construct for many mutants, isee ARNISOB1-RISI25 and ARNISIB-1819.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTWTRVLGGVLPALPQVVCNYR 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immuniting selected mammalian species with antigenically modified peptides for the production of polyclonal antibodies for contraception, abortion or treatment of hormone-related disease states such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The administration of a polypeptide determinant of a reproductive hormone such as human chorionic gondocropin (GG) can be used to produce non-immunogent polyclocal antibodies (Ab) specific to that hormone. This process is useful for contraception, abortion and for treating hormone related disease states and disorders such as hormone-associated carcinomas. The polyclocal antibodies can also be used to boost an animals resistance to exogenous protein e.g. viral proteins. The method is safer to use and has less sorious side effects than the administration of steroids consisting of synthetic non-protein hormones, which were used conventionally.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The invention relates to the production of analogues of a heterodimeric subunit giycoporcian hormone (GR9), e.g. human chorionic gonadotropin (hCG), human intensial promone (RF8), human intensial promone (RF8), human intensial promone (HE8), human follicle stimulating hormone (HE8), human intensial promone (HE8), and intentional matching, which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit opsteine, for certain proved stability, the analogue retaining at least a portion of the human continulation of the corresponding native GPH seeptor. This sequence to represents the wild type hCG-beta subunit used for the generation of the corresponding native GPH seeptor. This sequence to reduce perturbation of the 3-diamensional structure of the hormone, thereby creating greater likelihood that the diamer will be formed in vivo and the formed diamer will have affinity for the native receptors and have special activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRPQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents human chorionic gonadotropin (CG). The invention is based upon the discovery that mutent the invention is based upon the discovery that mutent the full of the invention is based upon the discovery that mutent the man by propredict in bornone common alpha subunit (see ANYOSTAG) and mutent human thyroid stimulating hormone (TSB) beta subunit (see ANYOSTAY), each comprising amino acid substitutions relative to the vild type sequences, can be produced and absembled to form mutent TSH heterodems relative to the vild type sequences, can be produced and assembled to form mutent TSH heterodems comprises the TSH beta in once mabodiment, a mutent TSH heterodian comprises the TSH beta subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the antibodies and analogues are treating or disorder characterised by the presence of creating for a disorder characterised by the presence of creating for a disorder characterised by the presence of creating cor a disorder characterised by the presence of characterised and analogues and also be used for the targeted delivery of the TSH beterodiants can also be used for the targeted delivery of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; hTSH; htwan torforfontc gonaddroppin; human luceinfsing hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Indels 0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 SKEPLRPRCRPINATLAVEREGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61

The present invention provides the sequences of several immunogenic epitopes and antibodies to human chorionic gonadotrophin (hGD). These can be used in the treatment of cancers where hGG synthesis occurs. Including badder, parcreatic, cervical, colorectal, iung, osesphageai, breast, adding gastric, prostate, oratio, uterine and endometrial cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Methods for producing heterodimers, particularly analogues of hormones,

Fragments of the protein were used in the methods of the the fuvention which involve the use of DNA vaccines encoding hCG antigens to induce an immune response and enable the treatment of cancer and provide a novel method of fertility control. In particular, they can be used to treat colorectal, breast and lung cancer, as hCG is associated with these types of tumours.
                                                                                                                                                                                                                                                                                                                         Inducing immune response to human chorionic gonadotropin (bCG), useful for treatment of cancer and fettility control comprises exposing cells to nucleic acid construct encoding hCG immunogenic epitope.

This sequence is a fusion protein of RCC and Jun. The invention cleares to a method of forming a cysteine knot protein (1) having alpha cleares to a method of forming a cysteine knot brotein (1) having alpha conditions are also and beta-subunits comprising attaching a dimerisation domain (DD) to either the N'termina of the harmonic soft in the case of the capture and to the C-terminus of the beta-subunit and to indicate the C-terminus of the beta-subunit and dimerising the products to form a heterodimeric protein analog (II). The method is customer, the conditions of the capture of a social set with excessive the caused by polycystic ovarian disease (associated with excessive sevenes of lutenisis in formone). Products that retain DD's are also useful as immunogenes or antigens (since a DD may contraining highly antigenic almon acid sequences). Attachment of a DD (Which may be removed later) facilitates the formation of heterodimers, that have similar structures can allows the combination of subunities that vould other-target conditions and almonogenes of subunities that would other-target conditions and almonogenes. Retaining part of a glycoprotein hormone my be modified without loss of activity, and attachment of the DD reduces to committee. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                              Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a
                                                                                                                                    This sequence is a fusion protein of HGG and Jun. The invention relates to a method of forming a cystein knot brotein (i) having alpha calculates to a method of forming a cystein knot brotein (i) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the Witermini of both subunits or the Witerminia of the charmania of the charmania of the charmania of the charmania of the beta-subunit and dimerising the products to form a heterodimeric protein analog (II). The method is considered to products a form a heterodimeric protein analog (II) and method is considered by polycystic ovarian disease (associated with excessive facilitates the formation of heterodimers, that have similar structures cannon acid asquences). Attachment of a DD (which may be removed later) facilitates the formation of heterodimers, that have similar structures and allows the combination of subunits that would otherwise combine and and and the without loss of subunits, and attachment of the DD reduces be maddified without loss of activity, and attachment of the DD reduces of the condition than abunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormolle; infertility; immunogen; antigen; polycystic ovariata disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun

This sequence represents a fusion protein of the human chorionic conditions of forces between the fuserion relates to a method of forming a cyteine knot protein (1) having alpha and method of forming a cyteine knot protein (1) having alpha and method of forming a cyteine knot protein (1) having alpha and method of forming a cyteine knot protein (1) having alpha and method of forces bubbints of the N-terminu of the alpha-subunit and the cytein (10) to either the N-terminu of both subunits or the N-terminus of the alpha-subunit and the cytein (1) the method is used to produce analogues (agonists or antagonists) of deglycosylated gyproprotein cannones, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive levels of intendising hormone). Products that retain Do's are also useful as intending and intendising highly antigenic amino acid sequences). Attachment of a Do (which may be removed later) and thus receptor-binding and immunogenic properties) to native dimers, and thus receptor-binding and immunogenic properties) to native dimers, and thus receptor-binding and immunogenic properties combine poorly, or not at all The N-terminal part of a glycoprotein expective which and individual subunits.
                                                                                                                                                                                                                                                             Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 SKEPLRPRCRPINATLAVEKBGCDVCITVNTTICAGYCPTHTRULGGULPALGQVCNTR 61 SKEPLRPRCRPINATLAVEKBGCPVCITVNTTICAGYCPTHTRULGGULPALGQVVCNTR 127 68 SKEPLRPRCRINATLAVERGCPVCITVNTTICAGYCPTHTRULGGULPALGQVVCNTR 127

                                                                                                                                                                                                                                                                                                             This sequence is a fusion protein of HGG and Jun. The invention are relates to a method of forming a cysteine knote protein (i) having alpha and beta-subunits comprising a testeine knote protein (ii) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the Writermini of both subunits or the Writerminia of the both subunits of the beta-subunit and interest of the C-terminus of the beta-subunit and indirection and the control of the C-terminus of the beta-subunit and interising the percentage to produce analogues (sgonists or antagonists) of deglycosylated glycoprotein hormones, potentially useful, e.g. for treeting infertility where caused by polygystic ovarian disease (associated with excessive them the formation of stakes a Do may containing highly antigenic animon acid sequences). Attachment of a DD may containing highly antigenic cannot acid and public states and of heteroflamers, that have similar structures and allows the combination of subunits that would otherwise combiners, on a allows the combination of subunits that would otherwise combiners, be modified without loss of activity, and attachment of the DD reduces by formation of homodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                             Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorlonic gonadotrophin; beta subunit; therapy; Jun.

The sequence represents the amino acid sequence of single chain goadortopin had analogue 11. The givocoptein homomoe analogue 13. The givocoptein homomoe analogue 14. The givocoptein homomoe analogue 14. The givocoptein homomoe and the common of the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native commone. The single chain protein is further useful as a reagent in a manner similar to the herapeodimer, as a diagnostic tool to detect the commoner similar too the herapeodimer, as a diagnostic tool to detect the bottopical samples, as a control reagent in assay kits for assessing the bological samples, as a control reagent in assay kits for assessing the complexes of these hormones in various samples, and in detecting and puritying receptors to which the native hormones blund 'the single chain common of the heteroclamers or homodimers have the following advantages over their diamer; forms; they are more stable, problams of recombinant commons and analogue of the heteroclamers or homodimers have the following advantages over their diamer; forms they are made since only a single gene is needed to transcribe, truning of activity pleased since only a single gene is needed to transcribe, truning of activity presents and of in vivo half lives. Single chain forms are unique starting macerials for identifying truncated forms with the acceptance of the process, proved and the submitte permitts the process in the process of the process
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is a fusion protein of HGG and Jun. The invention relates to a method of forming a cysteine knot protein (1) having alpha and relates to a method of forming a cysteine knot protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termina of both subunits or the N-termina of the call that the N-termina of the beta-subunit and dimerising the products to form a heterodimeric protein naming of the method is to produce analogues (spoinss or a magnists) of dealyrosylated superporterin homones, potentially useful, e.g. for treating infertility useful as immunogens or antigens (since a DD may containing highly antigenic as inmunogens or antigens (since a DD may containing highly antigenic anino acid sequences). Attachment of a DD (which may be removed later) facilitates the formation of heterodimers, that have similar structures and lows the combination of subunits that would otherwise combines. On the allows the combination of subunits that would otherwise combines. Depoily, or not at all The N-terminal part of a glycoprotein hormone may be conditied without loss of activity, and attachment of the DD reduces to vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

The invention relates to human single chain forms of the glycoprotein hormone quarter which is an agonist or attaconist of luteinising hormone [LH], follicle stimulating hormone [FSH], thyroid stimulating hormone [FSH], thyroid stimulating hormone [FSH], thyroid stimulating hormone having identical alpha subunits and differing beta subunits. The agonist forms of single chain hormones are used in treating infertility, as aids associated with the native hormones, and other therspectic methods associated with the native hormones. The single chain hormones are useful detect the presence of antibodies with respect to the native proteins in biological samples, as control reagents in assay kits for assessing the

Good and corporate 18.

Good and corporate in The juyopotcein hormone analogue is considerable analogue 18.

CC useful for generating antibodies specifically immunoreactive with new compounds, as a substitute for the heterodiment of the promones, in the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormone. The single chain protein is further useful as a reagent in a manner similar to the hatrodimer, as a disquestic tool to detect the commone. The single chain protein is further useful as a reagent in a manner similar to the heterodimer, as a disquestic tool to detect the blood can another a control reagent in assay lits for assessing the composition of an another proteins in the party of presence of antibodies with respect to the native proteins in the control of an another production as not only a sample, and in detecting and process, provide an afternate form thus permitting fine translate and process, provide an afternate form thus permitting fine culling of activity levels and of in "vivo half lives. Single chain forms care unique starting materials for identifying truncated forms with the catching to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to human single chain forms of the glycoprotein champed quarter which is an aponiato or antagonist of intensinising hormone componence (HJ), follicle stimulating hormone (FJ), follicle stimulating hormones are heterodimers having identical alpha subunits and differing beta subunits. The aponiat corresponds in the control of subunits, the aponiation of single chain hormones are used in a vitro fertilisation techniques, and other therapeutic methods associated with the native hormones. The single chain hormones are useful as receptoral samples, as control respents in assay kits for assessing the levels of these hormones in various samples, in detecting and purifying ceeptors to which the native hormones blud. The single chain hormones are also used in affairly chromatographic preparation of receptors or celeptors to which the native hormones blud. The single chain moments can easily considered as purification tools for celeptors to which the native hormones abunitatered as a fungs. The single chain moments of single chain hormones administered as a fungs. The single chain of subsequent preparations of these materials and to monitor (evels of single chain hormones administered as a fungs. The single chain of subsequent to operate antibodies specifically immunoractive (hormones. The present sequence is human single chain gonadorropin analogence of hormones. The present sequence is human single chain gonadorropin and consider the parting of human chorlonic gonadorropin and single chain gonadorropin and consider template directed vaccine design and for the development of hormone-specific vaccines for use in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
levels of these hormones in various samples, in detecting and purifying receptors to which the native hormones bind. The single chain hormones con articles are also used in affinity chromatographic proparation of receptors or antibhormone antibodies. They are used as purification tools for continuous of subsequent preparations of these materials and to monitor of stopporteins are used to generate antibodies specifically immunorative vith these new compounds, as substitutes for the heterodimeric forms of hormones. The present sequence is human single chain analog cof human choical control gonadorropin (CS) beta subunit (1-18 annio acids) cof human single chain gonadotropin analog cof human choicale chain gonadotropin analog cof human single chain gonadotropin subunit (1-18 annio acids) by a linker sequence. This analog serves as a useful starting compound for use in humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Location/Qualifiers

11.165

Anote—"Corresponds to 1-145 amino acids of human chorlonic gonadorropin (CG) beta-subunit.

166.173

Anote—"Linker peptide"

174. 265

Anote—"Corresponds to 1-92 amino acids of human single chart gonadotropin alpha-subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; single chain gonadotropin analog no:la; anti-infertility; drug; peptide therapy; lutefailsing hormone; Lif; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorlonic gonadotropin; CG; glycoprotein; infertility; fusion protein; mutant; mutein.
